

BUGBELLY

TOP POND'S
GREEDIEST FROG!

Frog Life Cycle

In nature frogs hatch from frogspawn. First they develop into tadpoles and then grow to become little froglets.

DAY 1

Fertilised jelly egg

Egg

Embryo

DAY 3 - 4

Tadpole - early stages

2 WEEKS

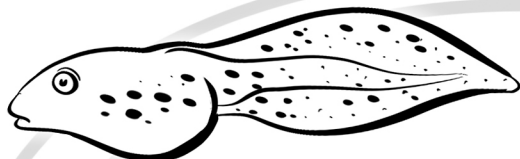

They can breathe underwater using gills

5 WEEKS

Tadpole - late stages

Tadpoles attach to plants using their mouth.

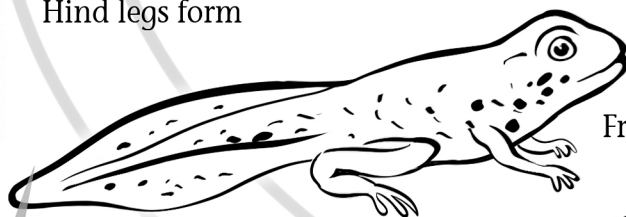

8 WEEKS

They feed by nibbling on algae.

Hind legs form

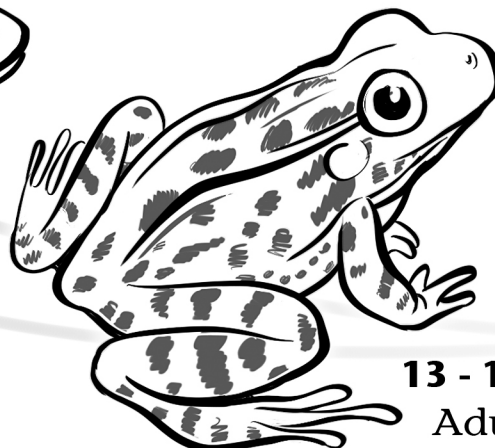

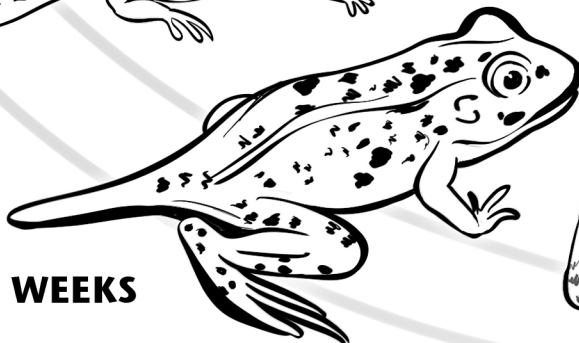

10 WEEKS

Front legs form

12 WEEKS

Tail becomes shorter
froglet leaves the water

13 - 16 WEEKS
Adult frog

Remember in my story, the taddies couldn't escape from Top Pond because their legs hadn't grown.
